

Leading lab jet, $R = 0.4$, with $Q = 5-7.5$ GeV held fixed as well as the colour-frame energy. The lines still climb by 44% over $p_T^{\text{lab}} = 1.9-7.3$ GeV: the cone keeps a p_T -dependent fraction of the shower. Both axes are logarithmic and this figure and the next share a vertical span, so equal visual slope means equal fractional change.
