

n_{SD} , standard pp variables in the laboratory

● $Q = 2.2\text{--}3.3$ GeV ■ $3.3\text{--}5$ ▲ $5\text{--}7.5$

The same cells and the same laboratory measurement, with soft drop written the standard way: transverse-momentum fractions and a rapidity-azimuth distance. Identical vertical span to the previous figure. The lines are flat, median exponent -0.016 : an IRC-safe observable measured entirely in the laboratory, with no boosting and no knowledge of the colour rest frame beyond the (W, Q) binning.
