

Each line is one cell of fixed (W, Q) , so fixed colour-frame kinematics, measured in three EIC beam configurations. The beam energy changes only the lab frame. Along each line the current hemisphere's lab momentum moves by up to a factor of ten and $\langle n_{90} \rangle$ does not follow: median slope $d \ln \langle n_{90} \rangle / d \ln p = -0.05$ per cell, against $+0.28$ for the inclusive curve (grey). Marker shape encodes the Q bin, colour the W bin; each Q bin is drawn as one sheet spanned by beam energy and W .
