

$\langle n_{90} \rangle$  for jets with  $|\vec{p}|_{\text{lab}} = 4.5\text{--}10\text{ GeV}$

DIS separates the two scales that coincide in  $e^+e^-$ : the energy of the colour rest frame ( $W$ ) and the virtuality that starts the shower ( $Q$ ). Read along a row for the  $W$  dependence at fixed  $Q$ , down a column for the reverse. Cells with fewer than 40 jets are blank.
