

Every rung is the same physics, measured differently. Ticks are individual (W, Q) cells across the 5×41 , 10×100 and 18×275 GeV configurations, which move the same colour-frame system through lab momenta differing by up to a factor of seven; the dot is the median. Defining the jet by the colour rest frame and computing n_{90} from momenta in that frame leaves no measurable dependence on the lab. Each departure from that is a choice made in the laboratory, not a property of the fragmentation.
