

$\langle n_{90} \rangle$ for jets with $|\vec{p}|_{\text{lab}} = 4.5\text{--}10$ GeV

DIS separates the two scales that coincide in e^+e^- : the energy of the colour rest frame (W) and the virtuality that starts the shower (Q). Read along a row for the W dependence at fixed Q , down a column for the reverse. Cells with fewer than 40 jets are blank.
