

The same cells and beam configurations for the leading anti- $k_T$  jet clustered in the laboratory at  $R = 1.2$ , the radius EIC studies use: median slope +0.011, against +0.22 for the inclusive curve (grey). A plain lab cone of sensible size is already frame independent; the  $R = 0.4$  of the reference paper is the worst case, shown in the radius scan.
