

Every rung is the same physics, measured differently: n_{90} (circles) and the IRC-safe iterated soft-drop multiplicity in its standard hadron-collider form (squares). Bars span individual (W, Q) cells across the 5×41 , 10×100 and 18×275 GeV configurations, which move the same colour-frame system through lab momenta differing by up to a factor of seven. Once the colour-frame kinematics are fixed, nothing measured sensibly depends on the laboratory; the steep inclusive slope is the sample changing, not the fragmentation.
