

The identical test for jets clustered in the lab with anti- k_T $R = 0.4$, carrying the same colour-frame labels and drawn on the same vertical scale. The slices collapse onto one rising curve and span 85%: a lab-frame jet definition measures the lab cone, not the fragmenting system.

Pythia 8 NC DIS, $10 \times 100 \text{ GeV}$, anti- k_T $R = 0.4$, $p_T^{\text{lab}} > 2 \text{ GeV}$,
 $|\eta| < 3.5$, Breit current hemisphere
